

Long Arm Quilting Machines

Author: Karen Lincoln

Quilting has been an age old tradition. In days gone by, women used to gather around and do quilting work together. This was quite exciting for them, as they would get to meet one another, as well as do things that they enjoy together. Quilting has also passed down to generations, and is still carried out by many. Quilters love to spend their time, sewing and patching different pieces of fabrics together and seeing their designs taking shape.

In the olden days, quilts were made by hand, as no machines were available then, and this was quite a time consuming process. If the quilt was small, then it would not take much time. However for larger quilts, time taken to complete was much longer, and these were quite tough to handle. Can you picture, a group of women, all sitting together, making a large quilt, and constantly having to get up and move, in order to cover each part of the quilt. Sounds tiresome doesn't it?

Thanks to technology, all this has changed. Though there are many, who still prefer to make hand made quilts. Nowadays, you have machines to help you with your quilting. These days, women don't have the patience, nor the time to sit and hand make quilts, more so if its a large quilt. In today's age, you'll find mostly machine made quilts, as hand made quilts have become extremely rare. Machines make the quilting process much quicker, and a lot easier. You can either use a regular [sewing machine](#), which has quilting capabilities or you can use a long arm [quilting machine](#), which is exclusively meant for quilting.

The long arm quilting machine is extremely popular. These machines are specifically meant for quilting larger quilts. Its arm is around 18 inches. These machines are electronic, and make the process of quilting rather quick, as it covers a wider area in a short span of time. Moreover, its much more comfortable as you don't have to keep getting up and changing your position or the quilt's position. This long arm machine makes the quilting process much more efficient, and is time saving as well. You can now make a quilt with a long arm quilting machine in a short period of time, and with not too much of effort.

A regular sewing machine can also be used for your quilting purpose. However the main draw back with a regular machine is that, its arm is just seven inches in length. And so the person who's making the quilt, can focus only on a portion of the quilt, at a time. Moreover, you have to keep shifting your position, along with the quilt, so that it fits into the sewing machine. This lands up being as uncomfortable and uneasy as making your quilts with hand, where you have to keep moving.

You can purchase a long arm quilting machine at various prices. The difference in prices is mainly due to the quality of the machine. Machines of well known brands, are naturally much more higher than the lesser known brands. It all depends on you, your budget and

how much your going to be using your long arm quilting machine. You rather spend a little more than compromise on quality. Alternatively you can wait for sales or discounts.
